Capabilities Overview

Technology Services Group®

TAG's Technology Services Group® specializes in offering innovative solutions to unique IT Challenges by providing world class engineering and manufacturing, experienced systems integration, and extensive program lifecycle management support. Our strength as a company lies in our adaptability and flexibility to various customer requirements. Through our end-to-end commitment to client satisfaction, TAG's technology solutions help support our customers' missions from concept through deployment.

Each TAG solution begins with a strong foundation in mechanical, thermal, and electrical engineering disciplines. TAG's thermal design services include advanced thermal simulation and modeling, which allows us to design solutions that combat the harsh climatic conditions to which our products may be exposed in the field. TAG's standard mechanical engineering services take full advantage of sophisticated Computer-Aided-Design (CAD) and fabrication techniques, which helps to reinforce the overall conceptual design of our products. To round out our integrated engineering service package, TAG's electrical engineering services focus on embedded design and component selection and analysis. This collaborative approach to engineering and design allows TAG to manufacture and deploy extremely robust and reliable products that meet or exceed the unique requirements of the field.

TAG's manufacturing and integration services include the rapid production of custom hardware and the integration of total turnkey systems. TAG's proven manufacturing and acquisition process reduces cost and expedites delivery schedules. Additionally, we offer a variety of integration services including component identification and ruggedization, vendor selection, inventory management, thermal optimization, power distribution, and weight balancing.

TAG's product support and lifecycle management capabilities extend far beyond typical post-sales service. In addition to managing warranties, field service, training, and quality assurance, TAG employs an entire team dedicated to supporting our products after delivery to end customers. We are industry experts in product longevity and legacy support, which includes detailed product roadmaps and extended availability of critical components.
